

Assessments

Cloud Security

Your First Step to Protecting Your Environment

In the age of digital transformation and fast-moving technology, organizations are grappling with greater security challenges. Now more than ever, security is mission-critical for any organization. As more services and data move from traditional data centers out to the public cloud, organizations need the right tools and insights to continue to secure their IT infrastructures and valuable data.

Essential Assessments

Get the tools and expertise needed to check the state of critical elements of your IT environment. Groupware Technology has partnered with TrinSecurity to deliver a number of essential baseline assessments for our customers.

With TrinSecurity's scoring matrix, we use a sliding scale to illustrate your overall security health after analysis and after remediation to close security gaps, to show continual progress of your ongoing security initiatives. We will then continue to work with your organization to ensure security standards are met and best practices are followed.

We offer assessments for:

- Microsoft 365/Office 365
- Azure
- AWS
- Google Cloud Platform
- Penetration Testing
- Vulnerability Testing

Each assessment includes:

- A comprehensive report outlining the findings of our analysis
- Steps to eliminate the discovered vulnerabilities
- Guidance with the process of remediation

Is Your Organization Security-Ready?

Powered by award-winning solutions, our assessments offer vital and actionable insights delivered through detailed analysis and reports.

Our baseline security reviews in Microsoft 365/Office 365, Azure, Google Cloud Platform and AWS improve the security of each environment by:

- Performing a total overview of the environment based on customer needs
- Recommendations for implementing custom best practice security configurations and settings
- Guidance towards applying malicious activity notifications
- Defining administrative roles and verifying proper access controls
- Recommending additional security tools and other add-ons to bolster overall security

Penetration Testing

Penetration testing attempts to gain access or information into a target network to expose known and unknown vulnerabilities and make recommendations for remediation.

Several types of tests that can be performed are:

- White box
- Black box
- Covert
- External
- Internal

Vulnerability Testing

Vulnerability assessments identify and create an inventory of all the systems connected to a network.

This is necessary to get an environment cloud ready to ensure maximum protection of the company's data or to perform a review on a scheduled basis to ensure compliance needs are met or the cloud presence is secure.

There are two main types of assessments offered:

- External vulnerability scan
- Internal vulnerability scan

No matter what the security need, Groupware has the resources to help you address this huge challenge with our security assessments. For additional details and pricing, contact your Groupware Account Manager today.
